BUILDICY
BUILD THE FUTURE

SOLUTIONS GUIDE

AI Growth Systems

From incoming enquiries to organised follow-up and booked conversations.

A practical guide for clinic owners, real estate founders, operations managers and business owners. It explains what AI-assisted enquiry systems do, how the parts fit together, where people stay involved, what the systems depend on, and how to test one in a focused pilot.

This guide describes proposed capabilities and illustrative examples. It does not promise specific business outcomes.

> *"We don't just build software. We build the systems behind growth."*

buildicy.com · AI Growth Systems & Product Engineering Studio, Coimbatore, India

02 · THE WORKFLOW THIS GUIDE ADDRESSES

From first message to reporting.

Every business that takes enquiries runs some version of the same journey. This guide is about the middle of that journey: what happens between someone getting in touch and your team having a conversation with them.

01 Enquiry → 02 Response → 03 Qualification → 04 Routing → 05 Booking → 06 Follow-up → 07 Reporting

"Booking" means either a **booking request** (a time the customer has asked for) or a **confirmed booking** (a time actually reserved). These are different, and the guide keeps them apart.

Where friction can appear

Stage	Example of friction
Enquiry	Messages arrive across a web form, WhatsApp, calls and email, and nobody sees them all in one place.
Response	Messages wait while staff are with customers or the office is closed.
Qualification	Staff ask the same questions again and again, or key details are missing. (Qualification means collecting the details needed to decide who should follow up and how.)
Routing	Enquiries sit in a shared inbox with no clear owner.
Booking	Back-and-forth to find a time, and unclear whether a slot is confirmed or only requested.
Follow-up	Quiet enquiries are not revisited consistently.
Reporting	Nobody can say how many enquiries arrived, how quickly they were answered, or where they stalled.

These are examples of friction that can occur. They are not verified problems at every business. Discovery establishes what is actually happening in yours.

Three problems that are often confused

Problem	What it is about	Covered by this guide?
More leads	Generating demand through advertising, content, referrals and reputation.	No. Out of scope.
Better enquiry handling	Speed, completeness, routing and follow-up for enquiries you already receive.	Yes. This is the focus.
Better sales conversion	Whether handled enquiries become customers: offer, price, trust, timing and staff skill.	Supported, not controlled.

> **Automation does not create demand by itself, and it cannot guarantee a sale.** It can help enquiries that already exist get answered, routed and followed up more consistently.

03 · THE SOLUTION MODULES

Five modules, one workflow.

Buildicy scopes these as separate modules. A client may need one, or several connected together. Each is custom-scoped; none is presented as a ready-made product.

Entry points
AI funnels · AI receptionists

→

Core workflow
Workflow and CRM automation

→

Re-engagement
Lead follow-up and recovery

Knowledge assistants (LLM and RAG) sit underneath, giving the receptionist or your staff a way to answer questions from approved information.

How to read the module tables

Label	Meaning
Proposed	Something Buildicy would scope and build for you. It is a capability to be agreed, not an existing off-the-shelf product.
Dependency	Something that must be in place or confirmed for the module to work.
Illustrative	A typical or fictional example. It is not a client result.
Limitation	What the module cannot responsibly promise.

MODULE A AI Funnels

What it is	A guided path from first click to a routed enquiry: landing pages, forms, qualification questions and a booking path.
Where it may help ILLUSTRATIVE	A clinic with several services sends every visitor to one generic contact form, so staff must phone people to ask the same follow-up questions.
What Buildicy would scope PROPOSED	• Landing pages or form flows for chosen services • Qualification questions and routing rules • A booking path (calendar link or booking request) • Confirmation messages and basic submission tracking
Inputs and integrations DEPENDENCY	Brand assets and approved copy; services and locations · Your definition of a qualified enquiry · Destination CRM, inbox or calendar · Domain, hosting and analytics access
Human involvement PROPOSED	Staff act on routed enquiries · A named owner approves copy and questions
Example success measures ILLUSTRATIVE	Form completion rate · Share of enquiries with all required details · Time from submission to staff action · Booking requests created
Limitations LIMITATION	• A funnel does not create traffic • Paid ad management and ongoing media spend are separate unless explicitly included in the scope • Good page design does not guarantee conversion

MODULE B AI Receptionists

What it is	An assistant that answers approved administrative questions, captures enquiry details and hands over to staff when needed. It can work in chat (website or messaging apps) or by voice (phone calls).
Where it may help ILLUSTRATIVE	A front desk is busy with people in the building, and messages wait until someone is free.
What Buildicy would scope PROPOSED	• Approved FAQs and enquiry capture • Administrative qualification, such as service, location and preferred time • Booking coordination: a booking request, or a live-calendar booking where supported • Escalation rules and handover alerts to staff • **Chat and voice are separate scope options**
Inputs and integrations DEPENDENCY	Approved FAQs, hours and policies · Channel accounts and admin permissions · Calendar and CRM access · Escalation contacts and required languages
Human involvement PROPOSED	Staff review booking requests where required · Staff take over escalated conversations · Someone keeps approved content up to date
Example success measures ILLUSTRATIVE	First response time · Eligible enquiries handled · Human escalation rate · Booking requests · Accuracy in reviewed conversations
Limitations LIMITATION	• Channel availability depends on supported APIs (the interfaces software uses to exchange data), account permissions and provider rules • Voice adds telephony, speech-recognition and cost considerations • The assistant works only within approved content and does not replace staff judgement

MODULE C Workflow and CRM Automation

What it is	Rules that create records and move work between tools automatically. A CRM (customer relationship management system) is the tool where contacts and deals are tracked.
Where it may help ILLUSTRATIVE	Enquiries arrive in WhatsApp, email and web forms, and someone copies them into a spreadsheet by hand.
What Buildicy would scope PROPOSED	• Lead creation and duplicate-handling rules • Assignment, reminders and task creation • Status changes at agreed points • Reporting, such as a dashboard or scheduled summary
Inputs and integrations DEPENDENCY	Access to your CRM or sheet through a supported integration or API · Pipeline stages and assignment rules · User accounts and permissions · Your reporting needs
Human involvement PROPOSED	Staff update statuses the system cannot know, such as a sale outcome · A manager owns the rules and reviews exceptions
Example success measures ILLUSTRATIVE	Share of enquiries logged automatically · Time to assignment · Overdue follow-ups · Completeness of lead records
Limitations LIMITATION	• Buildicy does not claim compatibility with every CRM. Feasibility depends on the CRM's API, plan and permissions, and is confirmed in solution design • Automation follows the rules it is given. Unclear pipeline stages lead to unclear reports

MODULE D Lead Follow-up and Recovery

What it is	Agreed follow-up sequences, with messages and staff tasks, for enquiries that have stalled. Only eligible contacts are included.
Where it may help ILLUSTRATIVE	A prospect asks about a service or a viewing, then goes quiet, and there is no routine for a second contact.
What Buildicy would scope PROPOSED	• Eligibility rules for who may be contacted • Sequence timing and approved wording • Consent capture and opt-out handling • **Stop conditions:** a reply, a booking, an opt-out or a maximum number of attempts • Handover to staff when someone replies
Inputs and integrations DEPENDENCY	Evidence of consent or another permitted basis for contact · Approved message templates (some messaging providers require pre-approved templates) · Lead status data and staff contacts
Human involvement PROPOSED	Staff handle every reply and decide on exceptions · A named owner approves the sequences
Example success measures ILLUSTRATIVE	Eligible enquiries contacted · Reply rate and opt-out rate · Handovers to staff · Booking requests after follow-up (not all attributable to the sequence)
Limitations LIMITATION	• Consent and messaging rules differ by country and provider and must be reviewed for your deployment • An old contact list is not free revenue. Contacts may lack consent, be out of date, or react badly • A reply is not a sale

MODULE E Knowledge Assistants (LLM and RAG)

What it is	An assistant that answers questions from your approved documents. It uses **RAG (retrieval-augmented generation)**: the assistant first retrieves relevant passages from an approved knowledge source, then uses an LLM (large language model, an AI model that writes text) to compose an answer from them.
Where it may help ILLUSTRATIVE	Staff repeatedly search price sheets, policy documents and FAQs, or visitors ask product questions that are already answered somewhere.
What Buildicy would scope PROPOSED	• Preparation of the approved knowledge source • Retrieval setup and answer rules, such as showing the source and saying when it does not know • A test question set and a review view • A process for updating the content
Inputs and integrations DEPENDENCY	Current, approved documents with a named content owner · Access to where they are stored · A list of topics the assistant must never answer
Human involvement PROPOSED	A content owner keeps sources current · Reviewers sample answers regularly · Staff take escalations
Example success measures ILLUSTRATIVE	Accuracy on a reviewed test set · Share of questions answered from sources · Escalation rate · Staff time saved, if measured
Limitations LIMITATION	• **Retrieval does not eliminate incorrect answers.** The system can retrieve the wrong passage, misread it or combine sources badly • Outdated or conflicting documents produce outdated or conflicting answers

04 · ILLUSTRATIVE CLINIC WORKFLOW

A fictional dental clinic.

> **Illustrative example.** Example Dental Clinic is fictional. This is not a client case study, and the details in square brackets would be supplied and approved by a real clinic.

01 **Enquiry** — Website or permitted messaging →
02 **Service and location** — What is needed, and where →
03 **Approved FAQs** — Administrative questions only →
04 **Booking path** — A suitable route is chosen

05 **Confirmed appointment** — Only if a live calendar supports it →
06 **Booking request** — Otherwise, reviewed by staff →
07 **Reminder** — Where permitted →
08 **Human handover** — Whenever needed

Sample conversation (administrative questions only)

Visitor	What are the opening hours at your Marina branch?
Assistant	The Marina branch is open [approved opening hours]. Would you like to request an appointment?
Visitor	Do you accept my insurance? And how much is a whitening session?
Assistant	I can't confirm insurance coverage or treatment prices here. I can pass your question to the front-desk team so they can check. May I take your name and your preferred way to be contacted?
Visitor	Sure. Can I come on Thursday afternoon?
Assistant	I've sent a booking request for Thursday afternoon. The team will confirm the time with you. A request is not a confirmed appointment until they do.

Boundaries

- **No diagnosis or medical advice**, and no decisions about whether a treatment is suitable.
- **No invented insurance coverage or treatment prices.** The assistant uses only approved wording, or hands over.
- **No emergency triage.** The assistant is not designed to assess urgency and should direct people to the clinic or local emergency services.
- **Collect as little sensitive data as possible.** Ask for contact details and the requested service, not symptoms or history.
- **Review clinical and privacy requirements** for the clinic's location and deployment before launch.

05 · ILLUSTRATIVE REAL ESTATE WORKFLOW

A fictional real estate agency.

> **Illustrative example.** Example Realty is fictional. This is not a client case study, and details in square brackets would be supplied by a real agency.

01
Enquiry channel
A supported website, ad or enquiry channel

→

02
Key details
Budget, preferred area, property type and timing

→

03
Agent routing
To the agent who covers that area

04
Viewing request
Or an available calendar slot

→

05
Confirmation
By the agent or the calendar

→

06
Follow-up
Agreed reminders and follow-up

Sample conversation

Enquirer	I'm interested in a two-bedroom apartment in [area]. Is it still available?
Assistant	I can't confirm availability in this chat because listings change. I can ask an agent to check. Could you tell me your budget range, preferred areas and when you hope to move?
Enquirer	Around [budget], and in about three months.
Assistant	Thank you. I'll pass this to [agent name], who covers [area]. Would you like to request a viewing? These slots are open: [calendar slots]. If none suit you, the agent will suggest other times.
Enquirer	Is this a good investment? What return will I get?
Assistant	I can't give investment advice or quote returns. The agent can share the listing details and answer your questions.

Boundaries

- **No invented listing availability.** Availability is confirmed by an agent or a live listing source.
- **No guaranteed returns and no investment advice.**
- **No unsupported property or finance claims.**
- **No promised portal integration.** Buildicy does not promise direct integration with property portals such as Bayut or Property Finder until access and permissions are confirmed. How portal enquiries reach the system depends on what each portal and account allow, and is settled during discovery.

06 · WHAT THE CLIENT NEEDS TO PROVIDE

A short checklist before we begin.

Rough answers are enough at the start. Gaps are normal and are worked through during discovery and solution design.

- ☐ **Business information and approved FAQs**
  Services, locations, policies and the answers you approve.
- ☐ **Current enquiry channels**
  Web forms, WhatsApp, calls, email and portals.
- ☐ **Existing CRM and calendar**
  The tools in use, and the plan or edition.
- ☐ **Access permissions and account ownership**
  Who owns each account, and who can grant admin access.
- ☐ **Booking rules and operating hours**
  Slot lengths, who books what, and any buffers.
- ☐ **Handover contacts**
  Who takes over, and how they are alerted.
- ☐ **Approved wording for prices and policies**
  Or an instruction not to discuss them.
- ☐ **Data handling requirements**
  What may be collected, where it is stored and for how long.
- ☐ **Required languages**
  For conversations, forms and messages.
- ☐ **Expected enquiry volume**
  A rough weekly number, and any busy periods.
- ☐ **Definition of a qualified enquiry**
  The criteria, in your own words.
- ☐ **Approval owner**
  One person who signs off content and acceptance.

07 · PILOT PLAN AND EVALUATION

Test one workflow before committing to more.

A focused pilot is a small, bounded deployment designed to answer a simple question: does this work well enough, in your business, to continue?

Element of an example pilot	What it means
One business workflow	For example, new-patient enquiries for one service, or viewing requests for one area.
One primary channel	For example, website chat or WhatsApp, not every channel at once.
Defined operating boundaries	What the system may answer, what it must hand over, and when.
Test cases before launch	A set of realistic questions and edge cases, run and reviewed before real customers see the system.
Human fallback	A named person or team who takes over, with a clear way to be alerted.
Baseline measurement	How enquiries are handled today, measured before the pilot starts, so there is something to compare against.
Weekly review	A short regular session to look at conversations, escalations and issues, and adjust.
Clear acceptance criteria	Agreed in advance: what results and what level of reviewed accuracy count as success, and what failures would pause the pilot.

Timing. Buildicy does not set a fixed implementation timeline in this guide. Setup time depends on scope, integrations and approvals, and is set out in the proposal. After setup, a **30-day measurement period** is one option. Whether it is meaningful depends on enquiry volume and scope. If volume is low, a longer period may be needed.

07 · PILOT METRICS

How to read the metrics.

Metric	Definition	Note
First response time	Time from an enquiry being received to the first meaningful reply, from the assistant or a person.	Define whether closed hours count, and measure it the same way before and after.
Eligible enquiries handled	Enquiries within the agreed scope that the system took from start to an agreed outcome.	Excludes out-of-scope enquiries and spam.
Human escalation rate	Share of eligible enquiries handed to a person.	Neither high nor low is automatically good. Review the reasons.
Booking requests	Requests for a time that have been submitted.	Not yet confirmed.
Confirmed bookings	Appointments or viewings confirmed in a live calendar or by staff.	Distinct from requests.
Attendance	Confirmed bookings that were attended.	Only if the data is available.
Accuracy from reviewed conversations	Share of sampled conversations where answers were correct, within approved content and handled properly.	Named reviewers, agreed rubric.
Staff workload	Time spent on repetitive enquiry handling.	Only if measured, for example by a before-and-after sample.

Reading the results honestly. A booked appointment is not an attended appointment. An attended appointment is not revenue. Revenue is affected by season, advertising, pricing, staffing and much else, so changes in revenue should not be attributed entirely to the system.

What keeps the system accountable.

The points below describe how Buildicy would approach each area. Specific controls, settings and provider behaviour are not assumed. They are confirmed in the agreed solution design.

Area	Proposed approach
Approved knowledge sources	The assistant answers from content you approve and name an owner for. Where the answer is not in that content, it says so and hands over.
Limits on promises	The assistant is configured not to promise outcomes, prices, availability or advice unless you have approved the wording.
Authentication and access control	Access to dashboards, conversations and settings is restricted to named people. The method is chosen in solution design.
Logging and review	Conversations and key events are recorded so that they can be reviewed, tested and improved. What is logged is agreed in advance.
Data retention	You decide how long conversation and lead data is kept, and who can delete it. Retention settings are agreed before launch.
Human takeover	Staff can step into a conversation, and defined triggers hand it over automatically, such as a request the assistant should not answer.
Provider outages and fallback	Messaging, calendar and AI-model providers can be unavailable. The design defines fallback behaviour, such as telling the person the team will reply and alerting staff.
Monitoring and support scope	What is monitored, who is alerted, and what support covers are defined in the proposal. Availability depends on the deployed system, providers and agreed scope.

> **What this guide does not claim.** Buildicy makes no claims here about legal compliance, certifications, data residency or specific security controls. These have not been verified for any deployment. They must be reviewed and confirmed in the agreed solution design.

09 · ENGAGEMENT AND NEXT STEP

From discovery to a scoped proposal.

01
Discovery call
Understand the workflow

→

02
Workflow mapping
Priorities and constraints

→

03
Solution design
Integrations and boundaries

→

04
Scoped proposal
Scope, milestones, terms

What drives cost

Cost driver	Why it matters
Channels	Each channel has its own setup, permissions and provider rules.
Voice versus chat	Voice adds telephony and speech handling and needs more testing.
Enquiry volume	Affects usage-based provider charges and the monitoring required.
Integrations	Depend on the tools involved and what their APIs allow.
Languages	Each language needs content, testing and review.
Custom workflows	Unusual rules, approvals or reporting add design and build work.
Support requirements	Monitoring, review sessions and response expectations.

Three kinds of cost

Build and setup fee	The one-off work to design, build, test and launch the agreed scope.
Ongoing support	Maintenance, monitoring and improvement, as set out in the proposal.
Third-party charges	API, messaging, voice, hosting and AI-model charges, usually billed by the providers according to use. The proposal sets out which are estimated and who holds each account.

No prices are stated in this guide. Figures are set out in the proposal after discovery.

NEXT STEP

Book a discovery call to map your current enquiry workflow.

Email buildicy@gmail.com to arrange a discovery call.

Website buildicy.com **Portfolio** portfolio.buildicy.com

Contracting and invoicing details are confirmed in the project proposal.
